INTRODUCTION - Project Idea

- ▶ Make a single-window trivia-quiz browser game
- ▶ Support multiplayer and user registration
- ▶ Allow user to customise his/her experience for a game
- ▶ Save stats for each user onto the database
- ▶ Have a unique and competitive experience in each game mode

ORGANISATIONAL ASPECTS - Agile Methods

Why and how did we use them?

- ▶ All of the tasks and milestones were split into sprints
- ▶ Each sprint had a certain common goal to be reached
- ▶ Creating tickets and dividing them as-equal-as-possible
- ▶ Bigger tickets were split into smaller
- ▶ Multiple meetings per week
- ▶ Pair programming sessions for specific features

ORGANISATIONAL ASPECTS - Tools

- ▶ Brainstorming = Miro
- ▶ Prototyping = Figma
- ▶ Sprint and Tickets = ClickUp
- ▶ Testing APIs = Postman
- ▶ Deployment = Gitlab CI/Docker

TECHNICAL ASPECTS - Architecture

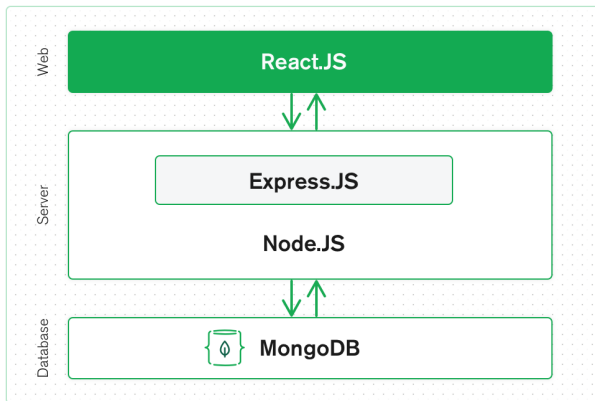

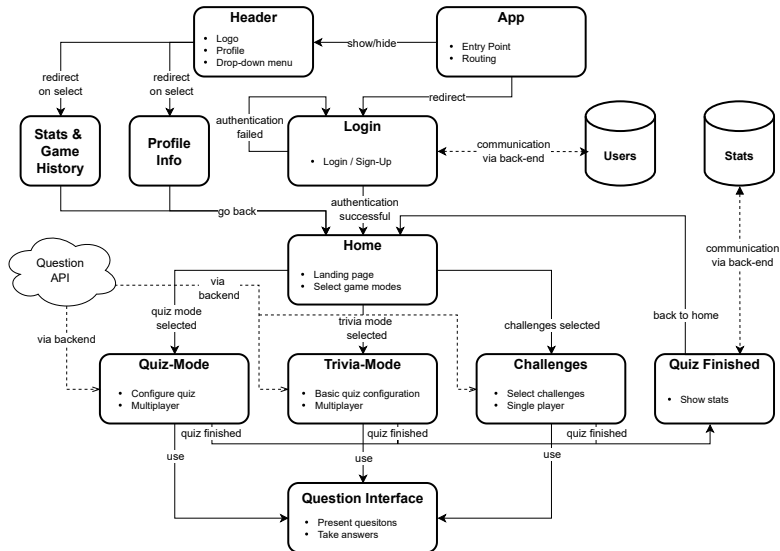

Figure: MERN tech stack (source: <https://www.mongodb.com/resources/languages/mern-stack>)

TECHNICAL ASPECTS - Front-end

React.js

- ▶ Component based UI architecture: components can be re-used
- ▶ Bootstrap for basic styles
- ▶ Communication with the back-end via web socket events

TECHNICAL ASPECTS - Front-end Component Hierarchy

TECHNICAL ASPECTS - Back-end

Node.js

- ▶ Game/session management: handles multiple clients at a time
- ▶ Supports single and 1v1 multiplayer games using socket rooms
- ▶ Question fetching via API
- ▶ Database communication
- ▶ User authentication

MongoDB

- ▶ Store user information
- ▶ Store game stats

TECHNICAL ASPECTS - Authentication

User authentication in our system involves several key steps:

User Registration

- ▶ Username, email, and password input
- ▶ Password must match special criteria for security

Password Storage

- ▶ Passwords hashed using bcrypt, no plaintext is stored

Login Process

- ▶ Username and password submission
- ▶ Password hashing and comparison
- ▶ User authentication and session initiation

Password Reset

- ▶ Email-based password reset
- ▶ Temporary password generation and hashing

These steps ensure secure handling of user credentials and authentication.

TECHNICAL ASPECTS - Database

MongoDB

- ▶ Stores user credentials and details
- ▶ Manages user sessions and activities
- ▶ Stores game statistics and player performance data

Database Communication

- ▶ Uses Mongoose ODM for interaction
- ▶ Establishes connection using connection URI
- ▶ CRUD operations for user and game data management

These practices ensure reliable data storage and retrieval.

TECHNICAL ASPECTS - Question API

Open Trivia API

- ▶ Provides arbitrary questions
- ▶ Can specify question type, category, difficulty
- ▶ Use session tokens to get no duplicate questions
- ▶ Example: `https://opentdb.com/api.php?amount=10&category=21&difficulty=easy&type=multiple`
- ▶ **IP restriction** – only one server API request every 5 seconds
 - ▶ How to handle error responses?
 - ▶ How to handle multiple request calls within 5 seconds?
 - Keep track of latest API call and wait for 5 seconds before making another one

TECHNICAL ASPECTS - Client-Server Communication

Example: Single-player game

- ▶ Clients connects to server
- ▶ Both clients and server emit and listen to events at all times
- ▶ Server notifies clients upon game end
- ▶ Bidirectional communication via socket.io

TECHNICAL ASPECTS - Multiplayer

How to handle multiplayer games?

- ▶ Clients join multiplayer queue
 - ▶ Match clients with identical game settings
 - ▶ Clients need to wait for match → show waiting screen
 - ▶ Join multiplayer socket room for mutual communication
- ▶ Start multiplayer game at the same time (2 players)
- ▶ Server waits for both clients to answer questions
 - ▶ The client to answer first needs to wait for the other client
 - ▶ Once all clients answered, the server sends a response
- ▶ Analogue to single-player, all clients are notified upon game end

TECHNICAL ASPECTS - Room for Improvement

- ▶ **Security:** password storage, authentication procedure
- ▶ **Scalability:** game management, session handling
- ▶ **Performance:** question fetching
- ▶ **Usability:** question quality/diversity, quiz configurability
- ▶ **Stats Tracking:** granularity, user display, leader-board(s)
- ▶ **Multiplayer:** inviting friends / hosting games, multiplayer challenges
- ▶ **Hosting:** the back-end server is not hosted
- ▶ **Testing:** only very limited testing, manual testing
